## Reed Switch Storage Conditions

### Overview:

Specification sheets for Comus International indicate temperature ranges for storage. However, long term exposure to extreme temperatures may lead to condensation and corrosion. Elevated temperatures or humidity may lead to oxidation.

### Conditions:

To minimize solderability and aging issues, the following recommendations for storage should be maintained:

- a. Maintain temperature in the range of +5 °C to +35 °C
- b. Maintain relative humidity less than 60%

When stored in these conditions , solderability should be maintained for more than a year. Storage for several years is possible. Stock after one year should be tested for solderability.
